Variable Types

Automatic Variable

a variable defined inside a function block.

invisible outside the function

*a local variable which is allocated and deallocated automatically
when program flow enters and leaves the variable's scope.*

External Variable

a variable defined outside any function block

Static Variable

*a variable that has been allocated "statically",
meaning that its lifetime (or "extent") is the entire run of the program.*

Global Variables

Variables declared outside any function definition
Accessible to any function defined in the same file
after the global variable is defined

Global Variables (A1, A2, A3)

Global Variables (A1)
